

React

React Explained for Absolute Beginners

Save For Later

React is a library used for
building frontend
applications.

A regular website consists of many pages, created using HTML/CSS and JavaScript.

But in the case of React websites, these are mostly or purely written in JavaScript.

Why React?

React makes it damn easy to
build web applications faster
and in a maintainable way.

But that is not it...

Learn Once, Write Anywhere

- You can learn React once and apply all the concepts of React to build Web, Mobile, and Desktop applications.

React is declarative, which means you do not need to define the steps of how things will change in DOM, you just need to define what things will need to change, rest will be handled by React.

That is it about React,
Anything to add, please
write it down in the
comments...
